Summary

Computer Science student and aspiring software engineer with a strong interest in systems programming, backend development, and computer networks. Experienced in building software projects using C, Go, and Python, including network applications, command-line tools, and full-stack platforms. Passionate about open-source development, problem-solving, and designing efficient, reliable software.

Education

Biskra University Bachelor Degree • graduate
Computer Systems Algeria, Biskra • 2023-2026
Studying core computer science and mathematics, including algorithms, data structures, operating systems, computer networks, databases, software engineering, and discrete mathematics. Completed practical projects in systems programming and software development using languages such as C, Go, and Python, with a strong focus on problem-solving and building efficient software.

Experience

Upwork Remote
Software Developer Freelancer 2024-2025
Delivered custom software solutions for clients, including backend development, bug fixing, automation scripts, and command-line tools. Collaborated with clients to gather requirements, implement features, troubleshoot issues, and deliver maintainable, high-quality code. Worked primarily with C, Go, Python, and SQL while using Git for version control and following industry best practices for software development and communication.

Open Source Maintainer Remote
Maintainer 2022-now
Contributed to open-source software by reporting issues, reviewing code, submitting pull requests, and improving documentation and functionality. Collaborated with maintainers through Git and GitHub, followed established contribution workflows, and gained experience working with large codebases, code reviews, and distributed software development practices.
github

Projects

LifeLink 2026
Developed a full-stack web platform to streamline the organ donation and transplantation process by connecting donors, recipients, hospitals,

and administrators. Implemented secure user authentication, donor and recipient management, organ matching workflows, and administrative dashboards to improve coordination, transparency, and efficiency throughout the transplantation process.

Smtp Server 2026

Developed an SMTP server in Go implementing core SMTP protocol functionality based on RFC 5321. Designed a connection state machine to process SMTP commands, manage mail transactions, validate protocol sequences, and handle concurrent client connections.
